These can be used in the diagnosis and treatment of cancers, particularly prostate cancer. The present sequence is a CDNA described in the invention

The present invention relates to novel prostate-specific proteins (PSP) and their coding sequences. The PSPs and their coding sequences are useful for stimulating an immune response in a patient, or for treating prostate cancer in a patient and for determining, detecting or diagnosing the presence of a cancer in a patient. The present sequence was used to
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       New prostate-specific proteins and genes, useful in gene therapy, particularly for stimulating an immune response in a patient, or treating prostate cancer in a patient, as well as for diagnosing prostate cancer

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    CCTCTCCCAGGGCCCCAGCCTGGCCACCTGCTTACAGGGCACTCTCAGATGCCCATAC 360
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The invention relates to a method of detecting prostate cancer by contacting a biological sample from a patient with: (a) a binding agent that binds to a polypeptide having an immunogenic portion of a prostate protein or its variant; (b) 2 oligonucleotide primers, where 1 of the oligonucleotides is specific for a DNA encoding the polypeptide of (a); or (c) an oligonucleotide probe specific for a DNA molecule encoding the polypeptide of (a). The method and polypeptides are useful for diagnosing, treating, particularly by immunotherapy, monitoring the progression, and inhibiting the development of prostate cancer in a patient. The polypeptides may be used to generate antibodies useful for the diagnosis and monitoring of prostate cancer. ABSSB350-ABSSB346

The invention relates to an isolated polypeptide comprising no more than 1-542 amino acids of ADB13563 comprising a sequence ADB148187. The peptides comprise a fragment ADB1363 of that contain naturally processed comprises a fragment ADB1363 of that contain naturally processed 7-cell epitopes for 3 class I major histocompatibility complex (MHC) alleles . ADB13653 is a polypeptide encoded by a human prostate specific CDNA, one of 648 disclosed as mew. Also included are nucleic acids in conding the proteins and peptides, expression vectors, a host cell transformed with the vector, an isolated antibody (or antigen binding fragment) that specifically binds to the protein or peptide, detecting fragment) that specifically binds to the protein or peptide beta the protein or appearing as ADB1358, detecting the amount of polypeptide that binds to the agent and comparing the amount of polypeptide that binds to the agent and comparing the amount of polypeptide to a predetermine duting appearing as peptides or protein or poptides or a tumour protein comprising contacting T cells with the apptides or petide to comprising contacting T cells with the peptides or unclain a patient and treating prostate cancer in a patient comprising contacting from a prient with the peptides or antigen presenting cells to the patient. The peptides (or an oligonaclectide (from a patient with the peptides or antigen presenting cells to the patient. The peptides (or an oligonaclectide contacting cells expressing the nucleic acids encoding, or antigen-presenting cells expressing the nucleic acids encoding the contact and administering the peptides, antigen presenting cells expressing the nucleic acids encoding to a cancer in a patient. The peptides (or an oligonaclectide or simulate or expand T cells specific for a tumour protein or treat or simulate or expand T cells specific for a tumour protein or treat or estimulate or expand T cells specific for a tumour protein or the petides, antibodes, tailon proteins, T cell populations or treat or prosta
                                                                                            New isolated polypeptide for use in a vaccine for stimulating an immune response, or for treating or diagnosis cancer, preferably prostate
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Sequence 385 BP; 86 A; 105 C; 94 G; 100 T; 0 U; 0 Other;

/note="Organ: brain; Vector: pOTB7; Site 1: Xho1; Site_2:
ECORI; cDNA made by oligo-dT priming. DIrectionally
cloned into BcoRI/KhoI sites using the following 5'
adaptor: GGACGAG(G). Size-selected >500bp for average
insert size 1.8kb. Library constructed by Ling Hong in
the laboratory of Gerald M. Rubin (University of
california, Berkeley) using ZAP-CDNA synthesis kit
(Stratagene) and Superscript II RT (Life Technologies).
Note: this is a NIH_MGC Library."

Clone from S. Wiemann, Molecular Genome Analysis, German Cancer

Research Center (DKF2); Banil s. wiemann@dkfz-heidelberg. de;

sequenced by Qiagen (Hilden/Germany) within the CDNA sequencing

consortium of the German Genome Project.

This clone (DKF2p6860529) is available at the RZPD Deutsches

Ressourcenzentrum fuer Genomforschung GmbH in Berlin, Germany.

Please conteact RZPD for ordering:

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Sequence 67, Sequence 67, Sequence 67,

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Sequence 67, Application US/09822827
Patent No. US20020001680A1
GENERAL INFORMATION:
APPLICAMT: W. Jiangchun
TITLE OF INVENTION: COMPOSITIONS AND METHODS FOR THE THERAPY AND
TITLE OF INVENTION: DIAGNOSIS OF PROSTATE CANCER
FILE REFERENCE: 210.21.534C1
CURRENT APPLICATION NUMBER: US/09/822,827
CURRENT PILING DATE: 2001-03-28
NUMBER OF SEQ ID NOS: 982
SOFTWARE: FastSEQ for Windows Version 3.0
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 .;
